

How to run our application – Tomcat server

There are a number of steps for both installation and running of a tomcat server, these instructions will be bullet pointed here.

- Download and install a Tomcat server found at <http://tomcat.apache.org/download-70.cgi>
- Install the additional libraries found in the filestore /remote-tomcat/tomcat/lib/mysql-connector-java-5.1.22-bin.jar
- Install the webapp from the filestore called “Monstermash” /remote-tomcat/tomcat/webapps/
- The application should be ready to run, you may need to reload the application/ start it in the manager page provided by Tomcat
- Setting up the SQL server requires you to import the .sql file for the table structure located in the filestore /sql/handyman_monster.sql
- SQL database connection information is referenced in the code directly, in the database package labelled TableConnector.java
